Have Extra-Terrestrials Visited White Lake?

Conrad Grégoire and David Overholt

April 1, 2024

New evidence uncovered in White Lake suggests that creatures from other worlds once visited White Lake. While on a pleasant float plane flight several years ago one of us (CG) photographed strange circles submerged in the shallows of White Lake (shown below).

After discovering the submerged 'crop' circles in White Lake, we waited several years in the hopes of meeting aliens during our bi-monthly lake sampling runs. We believed that they could help us in our studies by shortening the time needed to gather data on water quality and perhaps even persuade the cormorants to leave the lake permanently.

Nothing ever happened so we decided to dive on the site to discover the secret of the submerged crop circles. While doing this work, David Overholt literally stumbled on the fossilized skull of an extra-terrestrial being (shown below).

David Overholt (head not shown) holding fossilized head of alien creature

Shown to the left is the cleaned alien skull showing eye sockets and cat-like gaze.

The fossil alien skull discovered in White Lake is the archeological find of both the century and millennium. No brain cavity was found in the skull which may explain why this alien got lost in space and ended up here in White Lake. The reconstructed appearance of the alien is shown on the left.

As a result of this historic find, the mayor of a local township announced that the Waba Museum and Gardens

will be converted to an alien welcome centre. The new centre will house the latest model computer loaded with the most advanced version of Google Translate and Artificial Intelligence (AI) software tools. We believe aliens prefer to communicate using AI to specifically avoid talking directly to Canadians, whom they find uninteresting.

The site will provide landing facilities for several large flying saucers and up to ten cigar-shaped spacecraft. A nominal entrance fee will be charged to the visiting aliens to be paid in their local currency; star dust.

What Did We Really Find?

The submerged 'crop' circles in White Lake were investigated close up. We believe that the circles reflect the underlying geology. Large flat rocks in the area shown on the map can only support mats of very short aquatic plants such as Canada Waterweed on their surfaces. Just off of the rock, much larger plants such as Richardson's Pondweed can take root and appear to encircle the large flat rocks resulting in apparent submerged 'crop' circles.

Happy April Fool's Day!
